

North Shore Architecture and Interiors is proud to be the first design firm on northern Long Island to introduce permeable paving stone driveways. Permeable driveways are very cost effective since they do not require drywells for storm water run-off. This environmentally friendly solution reduces Long Island Sound and tributary water pollution. **Here's how permeable pavers work:** Storm water run-off is captured and channeled to a gravel sub base where the rain water slowly is absorbed by the soil below the gravel base.

Added Benefits:

- 100 % maintenance free, no catch basins to maintain- no drywells to clean out.
- Durable concrete pavers are stronger than ordinary concrete and clean easily, especially oil spills.
- Unlike asphalt no periodic re-surfacing is ever needed.
- Unlike poured concrete no patching and crack repairs are ever needed.
- Unlike gravel driveways pavers are easy to shovel and plow after snow storms.
- Concrete pavers are the ideal solution for driveways, walkways and patios.
- Permeable concrete paver driveways last forever!
